No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                        1296

The sequence is that of the gene encoding a glyphosate oxidoreductase (GON) enzyme, the gene sequence was synthesised so that it could be redesigned to eliminate as much as possible the following sequences or redesigned to eliminate as much as possible the following sequences or redesigned to eliminate avoiding the introduction of unnecessary restriction sites), stretches of G's and C's of 5 or more; A + T rich regions (predominantly) that could function as polyadenylation sites or potential RNA destabilisation regions, and codons not frequently corrected in plant genes. The G + CA for the synthetic gene is 51% and the potential to form short, high energy, hair-pin structures is cauced. However it still encodes the wild type GOR enzyme. It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant.

Transformed plants resistant to glyphosate can be obtd: so that weeds can be selectively controlled in fields contg. crops. ; 0 180 240 240 300 360 360 420 480 540 009 300 420 480 9 Gaps 1 ATGGTTGAGAACCACAAGAAGGTTGGTATCGCTGGAGCTTGGAATCGTTGGTGTTTGCACT 181 atgccaggaaacttgactagcgttccaaagtggcttcttgacccaatgggtccattgtcc AGACCAAACAAGGTGAAGGAAGCTAAGGCTAAGGCAAACCTCGTCATCAAGTCCACTGTG agaccaaacaaggtgaaggagcaagctaaggcactccgtaacctcatcaagtccactgtg CACCTTACCGTGTACCGTGGAGAAGCAGACTTCGCCAGGGACCGTGGAGGTTGGGAACTT cgtcgtctcaacggtgttcgtactcaaatcctcagcgctgatgcattgcgtgatttcgat cctaacttgtctcacgcctttaccaagggaatccttatcgaagagaacggtcacaccatc ATGCCAGGAAACTTGACTAGCGTTCCAAAGTGGCTTCTTGACCCAATGGGTCCATTGTCC CCTTTGATCAAGTCCTTGGCTGAGGAGGCTGATGCTAGCCACCTTATCCGTCACGAAGGT CGTCGTCTCAACGGTGTTCGTACTCAAATCCTCAGCGCTGATGCATTGCGTGATTTCGAT CCTAACTTGTCTCACGCCTTTACCAAGGGAATCCTTATCGAAGAGGAACGGTCACACATC ; 0 DB 13; Length 1296; transform plants to produce plants tolerant to glyphosate herbicide Indels Sequence 1296 BP; 271 A; 359 C; 305 G; 361 T; 0 other; 5, 0; Mismatches Score 1288; Pred. Inducible promoter linked to a gene (1) that confers resistance to a finducible promoter linked to a gene (1) that confers resistance to a funducible promoter linked to a gene (1) that confers resistance to a bycline (glyphosate) or its salts, but may also be a gene for resistance to a lycine (glyphosate) or its salts, but may also be a gene for resistance to, e.g. chloroacetanilides, glufosinate, sulphonyl ureas, imidazolones, confer the inducible promoter (e.g. alch, alck, alck, aldh or other alck-induced gene promoter) is operatively linked to an alc aldh or other alck-induced capression of (1) avoids the risk that constitutive expression in all interfere with plant development; allows volunteer plants to be controlled by herbicide applied without inducer and minimises the chance that herbicide resistant strains of weeds will arise. The expression cassette is strictly controlled and suitable for general use in plants (both mono- and dicotyledons). The alchale for general use in plants (both mono- and dicotyledons). The alchale for general use sometitutive expression of glyphosate oxides (GPX) in plants.

Switchable GOX was expressed alone or in conjunction with constitutive expression of 5-enol-pyruvylshikimate 3-phosphate (BPSPS) CP4. Constructs were optimised for expression in mono- and dicotyledonous crop species. The present sequence comprises a fusion of the GOX gene fused to the chloroplast transit sequence a from Arabidopsis RUBISCO (CPTI). This
   glyphosate, avoids constitutive expression and minimises development of herbicide tolerant weeds
                                                                                      59pp; English.
                           herbicide tolerant weeds

The gene sequence was redesigned to eliminate as much as possible the following sequences or sequence features (while avoiding the introduction of unnecessary restriction sites), stretches of G's and G's of Sor more; A + T rich regions (predominantly) that could function as polyadenylation sites or potential RNA destabilisation regions, and codons not frequently found in plant genes. The G + Gs of the GOR gene was reduced from 56% in the manipulated version (Q20B3) to 52% in the modified version. However it still encodes the wild type GOR enzyme. It was obtd. from bacterial isolate LBAA.

It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        308

It was obtd. from bacterial isolate LBAA. It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolorance of the plant. Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively controlled in fields contg. crops.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              188

                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence is that of a gene encoding a glyphosate oxidoreductase (GOR) enzyme. It was obtd. from bacterial isolate LBAA. It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant. Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively controlled in fields contg. crops. This sequence (fig 2) contains apparent discrepancies (see feature table) with a supposedly identical sequence (SEQ ID No.3 in the specification), since it is unclear from the specification which of these is correct, both sequences have been indexed.                                                                                                                                                                                                                            here"
                                                                                                                                                                                                                                                       here"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence is that of a gene encoding a glyphosate oxidoreductase (GOR) enzyme. It was obtd. from bacterial isolate LBAA. It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant. Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively controlled in fields contg. crops. This sequence (SEQ ID No.3 in the specification) contains apparent discrepancies (see feature table) with a supposedly identical sequence (fig 2), since it is unclear from the specification which of these is correct, both sequences have been indexed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel sugar beet plant, including its descendants expressing 5-enolpyruvylshikimate-3-phosphate synchase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capa of tolerating herbicide treatment with glyphosate (also known as N-phosphonomethyl-glycine) as the active ingredient, e.g. Roundup.

                                                                                                       ð
                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                 This invention describes a novel sugar beet plant, including its descendants expressing 5-enolpyruvylshikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capable of tolerating herbicide treatment with glyphosate (also known as
                                                                                                                                                                                                                                                                                                                                                                                               7384

```
This sequence is a fragment of the Kaposi's sarcoma-associated herpesvirus (KSHV) LUR (long unique region). This fragment contains coding regions for ORF65 which encodes capsid protein 1V, ORF66, ORF67 which encodes tegument protein IV, ORF68 which encodes a glycoprotein, ORF99, K12 which encodes kaposin, K13, ORF72 which encodes cyclin D, ORF73 which encodes immediate early protein (IPP), K14 which encodes CX-2 (v-adh), ORF74 which encodes G-protein coupled receptor, ORF75 which encodes tegument protein. K15. KSIW is a new human Herpesvirus (HHV8) believed to cause Kaposi's sarcoma (KS) which is the most common form of neoplasm occurring in persons with acquired immune deficiency syndrome (AIDS). The DHFR protein is useful for vaccination, prophylaxis, diagnosis and treatment of a subject with Kaposi's sarcoma and for detecting expression of a DNA virus associated with Kaposi's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Kaposi's sarcoma; acquired immune deficiency syndrome; AIDS; DHFR; Bcl-: dihydrofolate reductase; LUR; long unique region; vaccine; prophylaxis; diagnosis; treatment; HHV8; capsid protein IV; tegument protein IV; glycoprotein; kaposin; cyclin D; immediate early protein; IEB; OX-2; v-adh; G-protein coupled receptor; FGARAT; ds.

This sequence represents the long unique region and terminal repeat of the Kaposi's sarcoma-associated herpes virus (KSHV). KSHV is also known as herpes virus (HHVB). This sequence contains the DNAs of the cas human herpes virus (HHVB). This sequence contains the DNAs of the invention which encode KSHV polypeptides selected from: (a) viral macrophage inflammatory protein (MIP) II; (b) viral interleukin-6 (IL-6); (c) viral kRF I; (d) complement-binding protein; glycoproteins B, Mor L; (d) capsid protein IV encoded by ORF65; and (e) immediate early protein encoded by ORF73. Labelled probes for the nucleic acid, proteins encoded by it, and antibodies (Ab) specific for the proteins are useful for conceding allive, specifically for diagnosis of Kaposi's sarcoma, in body fluids or tissue samples. HHVB infections can be treated with antisense or triplex forming molecules or agents that bind specifically to the protein can be used in protective vaccines. Ab may also be used in the protein can be used in protective vaccines. Ab may also be used to the protein can be used in protective vaccines. Ab may also be used in the protein many many be used in many be implicated in many contains and the many many cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             e.g. treating rheumatoid arthritis. This sequence is stated as containing \mathbf{81} open reading frames.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              other lymphoproliferative diseases such as lymphomas, leukaemia, splenomegaly and mycosis fungoides. Cells and animals containing the nucleic acid are useful for drug screening. HHVB derived peptides can be used as targets for antiviral drugs, e.g. dihydrofolate reductase gene can be inhibited with methotreate. These can also be used to determine the immune status of a patient infected with HIV. HHVB derived protein viral MIP III may be used as an anti-inflammatory agent for,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                virus

SCAIII gene containing 73 copies of the trinucleotide (CAG) repeat unit (the present sequence) to a substrate, and hybridising with amplified testee genomic DNA containing copies of the trinucleotide units, PCR amplified with labeled primers (XB989-90). The new method is useful for diagnosis of SCAIII syndrome, and for determining the severity of the disease. The present sequence represents the SCAIII gene fragment containing 73 trinucleotide (TNR) repeats.
